

INSULATING MUSHROOM

MUSHROOM IN THE WALL - NOT A BAD THING

Young partners Bayer and McIntyre (Ecovative Design) are in the process of developing a new form of insulation. Mix water, flour and oyster mushroom, a mineral fertilizer and you will have the product "Greensulate", an organic, fire resistant insulating material, composed by an entirely organic process.

They are working to produce more copies of Greensulate so it will actually be used as insulation for buildings, but they will not put it on the market before they have a robust and mature product.
